

## What if the Program Cannot Find My Radio?

Programs wishing to communicate with a FLEX-6000 series radio must be given permission to go through the Windows Firewall. If they do not have that permission, they will not be able to “see” the radio.

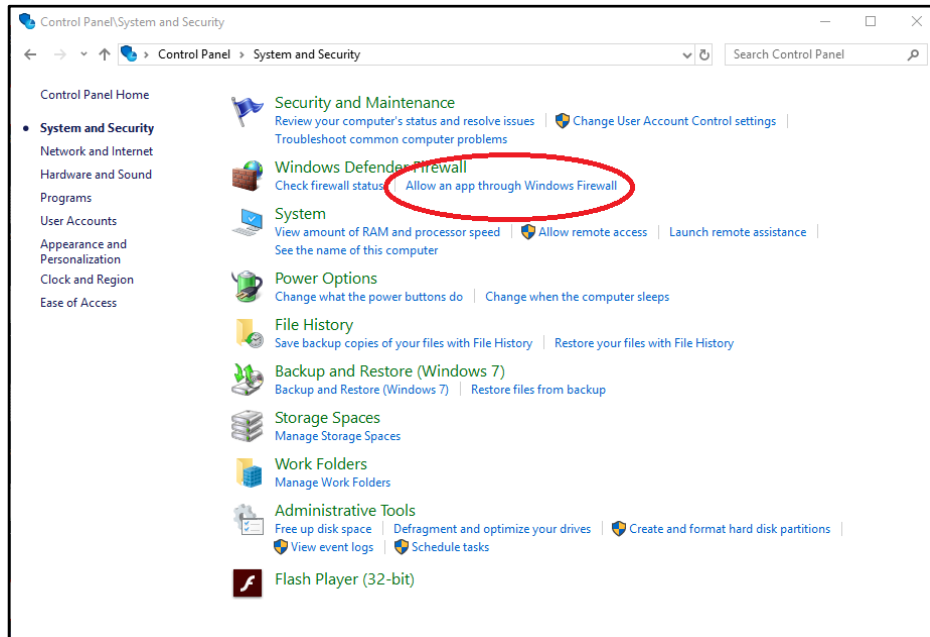

The following step-by-step instructions explain how to grant this permission:

1. Open “Control Panel”:
  - a. Hold the Windows key down & press “R”.
  - b. Type “Control Panel” in the box and press “Enter” or click on “OK”.

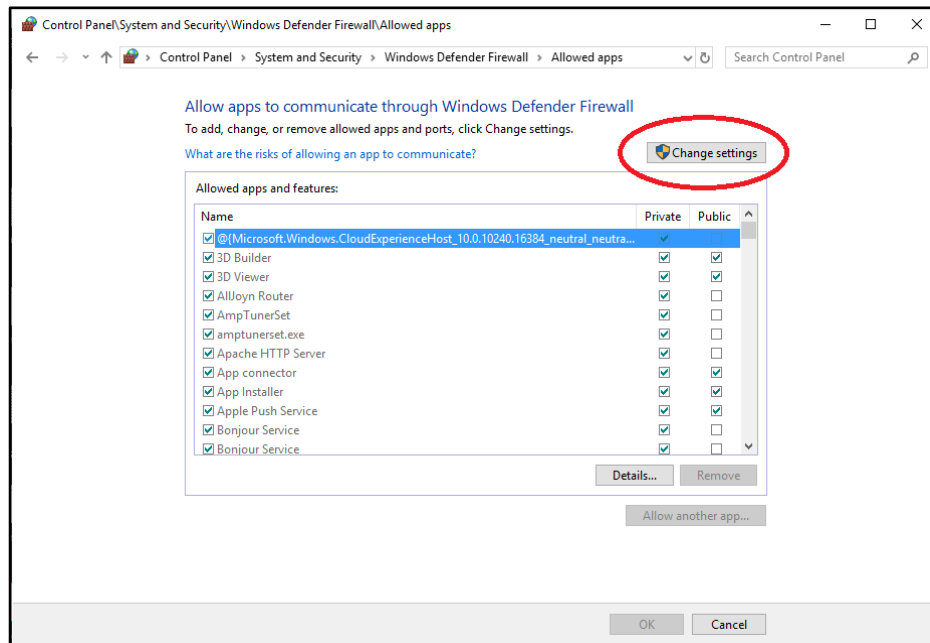

2. On the main Control Panel window, click on “System and Security”.

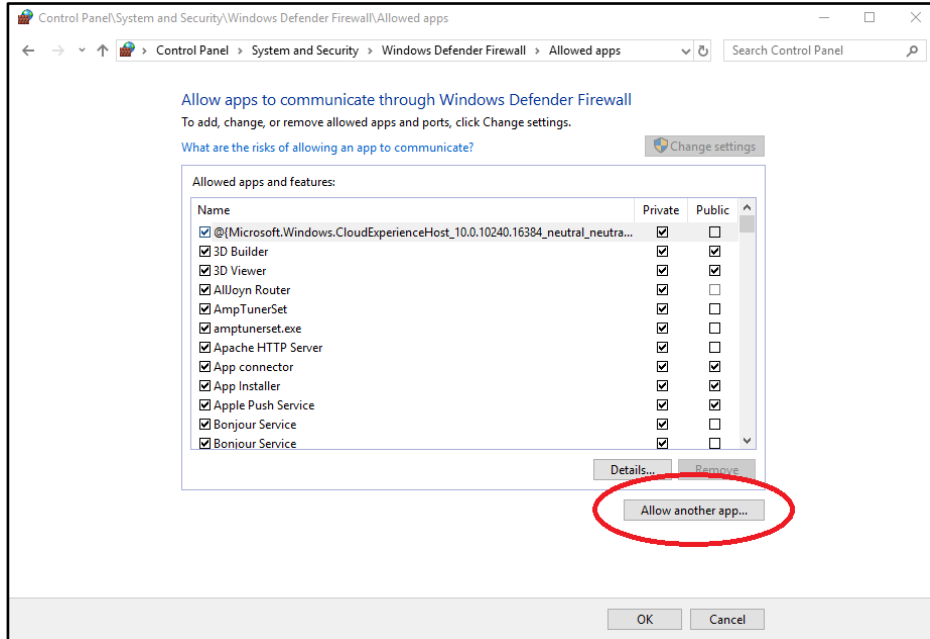

3. On the next window, click on “Allow an app through the Windows Firewall”.

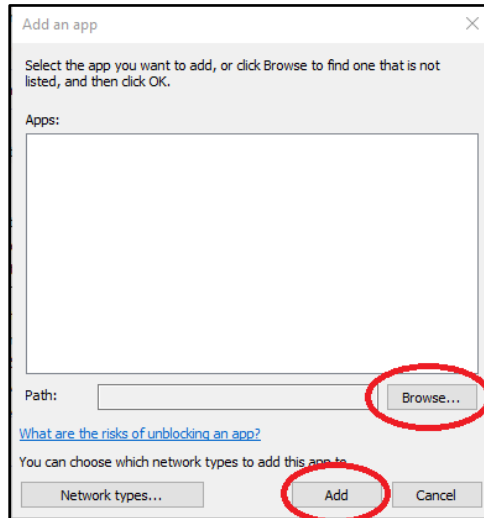

4. On the next window, click on “Change settings”.

5. On the next window, click on “Allow another app”.

6. A small window will open that will allow you to select the program and add it to the list of programs that have permission to go through the firewall. Browse to the program that you wish to allow through the firewall and click on "Add".

7. Close Control Panel.

Your program should now be able to connect with your radio.
